Docket # 66638/40337

Return Value:	Routine Name:	Arguments:	Description:
char*	vcuAllocateBuffer(.)	int channel	Allocates a buffer with proper caching properties, sized for the specified channel
unsigned int	vcuClearErrno(.)	none	Returns the first recorded VCU error # and clears it from the error system
void	vcuCommInit(.)	none	Starts the VCU service
void	vcuCommHalt(.)	none	Forcefully halts all VCU-related tasks
int vcuDataSize(.)		int channel	Returns the maximum message size, in bytes, for the specified channel
unsigned int	vcuErrno(.)	none	Returns the first recorded VCU error #
int	vcuFree(.)	int channel, const char *data	Marks the specified memory location in the socket Rx memory pool as usable (see detailed description)
void	vcuFreeBuffer(.)	int channel, char *buffer	Frees a buffer allocated with the vcuAllocateBuffer(.) routine
int	vcuHasPushQueueMessage(.)	int channel	Returns the number of messages in the push queue for the specified channel
int	vcuHasRxQueueMessage(.)	int channel	Returns the number of messages queued for the specified channel
int	vculfaceHasRxDataQueueMessage(.)	none	Returns the number of vcuRecv(.) replies queued
int	vculfaceHasRxRqstQueueMessage(.)	none	Returns the number of vcuRecv(.) calls queued
int	vculfaceHasTxQueueMessage(.)	none	Returns the number of vcuSend(.) calls queued
int	vculfaceHasTxReplyQueueMessage(.)	none	Returns the number of vcuSend(.) replies queued (used for push configs)
int	vculfaceHasTxStatusQueueMessage(.)	попе	Returns the number of vcuSend(.) status messages queued
int	vculsMemPairPoolEmpty(.)	none	Returns 0 if the mem pair pool (used for push configs) is not empty and a non-zero value if it is empty
int	vculsRxPoolEmpty(.)	int channel	Returns 0 if the receive pool for the specified channel is not empty and a non-zero value if it is empty

4/54

Return Value:	Routine Name:	Arguments:	Description:
int	vculsTxPoolEmpty	int channel	Returns 0 if the transmit pool for the specified channel is not empty and a non-zero value if it is empty
int	vcuPing(.)	int destination	Checks that a remote board is reachable via VCU. If more than one bit is set, a table is printed
void	vcuPrintChannelInfo(.)	int channel	Prints out the configuration information for the specified channel. If the argument is 0 (default), a table is printed
void	vcuPrintDebug(.)	int debugLevel	Triggers a printout of debugging data
int	vcuQueryForConfig(.)	int channel	Returns the configuration of the channel for internal VCU use (defined in vcuDefines.h)
unsigned int	vcuRecentErrno(.)	none	Returns the last recorded VCU error number
int	vcuRecv(.)	See Detailed Description	See Detailed Description
int	vcuRequestErrno(.)	int destination	Receives the VCU error # from a remote board. If more than one bit is set, a table is printed
int	vcuRequestTestPattern(.)	int destination, int channel, int msgSize	Requests a remote board to send a pre- defined test pattern of a requested size, and prints out success or error of delivery
int	vcuSend(.)	See Detailed Description	See Detailed Description

Figure 3(b)

Debug Level:	Description:
1	Prints out the use status of all Rx memory pools
2	Prints out the use status of all Tx memory pools
3	Prints out the use status of all Rx and Tx memory pools
4	Prints out detailed information about each slot of all Rx memory pools
5	Prints out detailed information about each slot of all Tx memory pools
6	Prints out detailed information about each slot of all Rx and Tx memory pools
7	Prints out the status of all Rx queues
8	Prints out the status of all push queues
9	Prints out detailed information about each slot of memPair memory pool
101	Prints out internal timing information if the system has been instrumented for timing

Application (108)

vcuRecv()

**Call vcuSocket.Recv()

**Receive from the vcuSocket queue,

based on the channel
**Write the value received into the appropriate argument.

**Return status.

**Set the message size to the value in the header of the message stored at the location indicated in the return value.

**Set the message location in the input argument

24/54

	VCU Configuration File Grammar: Backus-Naur Form (BNF)
	Top Level:
	<config_file>::=,channel_section> [<include_section>] [<handler_section>] [misc_section>]</handler_section></include_section></config_file>
Description:	The configuration file should contain a channel declaration section and may optionally contain entries for include files, handler files, and other miscellaneous parameters.
	Channel Declaration Section:
	<channel_section>::=Channels number <channel_statements></channel_statements></channel_section>
Description:	The channel declaration should begin with the keyword "Channels" followed by a number representing the number of channels in the system. This is then followed by said number of channel declaration statements.
- "	Channel Declaration Statements:
_	<pre><channel_statements>::=<channel_statement> <channel_statement> <channel_statements></channel_statements></channel_statement></channel_statement></channel_statements></pre>
	<pre><channel_statement>::=Chan number <channel_data_type> channel_name <channel_type></channel_type></channel_data_type></channel_statement></pre>
-	<pre><channel_data_type>::=[struct class] custom_type untyped byte_count</channel_data_type></pre>
	<pre><channel_type>::=recvbuf send pushbuf recvpool pushpool queue self overwrite qself</channel_type></pre>
Description:	A channel statement provides the channel <i>number</i> followed by the channel data type which may be a structure or class of user-defined <i>custom_type</i> , or an untyped string of <i>byte_count</i> bytes. The last two tokens in a channel statement should be the user-defined <i>channel_name</i> and the channel_type. There also should be as many channel statements as the number of channels declared in the beginning of the channel declaration section.
	Include File Section:
	<include_section>::= Include number <include_statements></include_statements></include_section>
	<include_statements>::=,include_statement> <include_statement> <include_statements></include_statements></include_statement></include_statements>
	<include_statement>::= Include include_file</include_statement>
Description:	The include file section provides a number of filenames that should be "included" by the file vculnterface.h generated by the VCU configuration utility. The section must begin with the keyword "Include" followed by a number representing the number of include files in the configuration file. This is then followed by said numbe of include statements. Each include statement starts with the keyword "Include" and is followed by the filename include_file which should be "included" by vculnterface.h.
	Handler File Section:
	<pre><handler_section>::=Handlers number <handler_statements></handler_statements></handler_section></pre>
	<handler_statements>::=<handler_statement> <handler_statement> <handler_statements></handler_statements></handler_statement></handler_statement></handler_statements>
	<handler_statement>::=Hndlr handlr_file</handler_statement>
Description:	The handler file section provides a number of filenames that should be "included" by the file vcuConfig.cpp generated by the VCU configuration utility. The section must begin with the keyword "Handlers" followed by a number representing a number of handler files in the configuration file. This is then followed by said number of handler statements. Each handler statement starts with the keyword "Handler" and is followed by the filename handler_file which should be "included" by the vcuConfig.cpp file.

Description:	Single parameter options should occur only once per configuration file, while multiple parameter options may occur several times, usually on a per-channel basis.
Poo	l Parameters:
	<pre><pool_parameters>::=BoardCount number [<norxpool_parameters>] [<notxpool_parameters>]</notxpool_parameters></norxpool_parameters></pool_parameters></pre>
	<norxpool_parameters>::=<norxpool_parameter> <norxpool_parameter><norxpool_parameters></norxpool_parameters></norxpool_parameter></norxpool_parameter></norxpool_parameters>
	<notxpool_parameters>::=<notxpool_parameter> <notxpool_parameter><notxpool_parameters></notxpool_parameters></notxpool_parameter></notxpool_parameter></notxpool_parameters>
	<norxpool_parameter>::=NoRxPool chan_number board_processor_number</norxpool_parameter>
	<notxpool_parameter>::=NoTxPool chan_number board_processor_number</notxpool_parameter>
Description:	The pool parameters indicate which, if any, channel/board combinations should not allow receiving or transmitting respectively. The parameter list begins with the "BoardCount" keyword followed by the <i>number</i> of boards, or system processors, in the system. This is followed by one or more "NoRxPool" or "NoTxPool" keywords which tell the system which channel/board pairings, indicated by <i>chan_number</i> and <i>board_processor_number</i> , should not allow receiving and transmitting respectively.
Acki	Mailbox Parameter:
	<ackmailbox_parameter>::=AckMailbox number</ackmailbox_parameter>
Description:	This option indicates which mailbox, represented by number, should be used for automatic acknowledgements. This value must be different from the DataMailbox value, and defaults to ∠.
Auto	AckOff Parameter:
	<autoackoff_parameter>::=AutoAckOff</autoackoff_parameter>
Description:	This option indicates that auto acknowledgement should not be used in the VCU system.
Auto	AckOn Parameter:
	<autoackon_parameter>::=AutoAckOn floating_point_number</autoackon_parameter>
Description: indicates the tin	This option turns on the automatic acknowledgement feature of the VCU system. The floating_point_number neout value in seconds before the message is assumed lost. This value defaults to 0.05 seconds.
Data	Mailbox Parameter:
	<datamailbox_parameter>::=DataMailbox number</datamailbox_parameter>
Description:	This indicates which mailbox, represented by number, should be used for inter-board communication. This value must be different from the AckMailbox value, and defaults to 1.

Docket # 66638/40337

	VCU Configuration File Grammar: Backus-Naur F rm (BNF) (cont.)
	Miscellaneous Parameters Section (c nt.):
Debu	ig Parameter:
	<debugon_parameter>::=DebugOn</debugon_parameter>
Description:	This option turns on the printing to console all values received in the data mailbox interrupt.
Mailb	oox Queue Size Parameter:
	<mailboxqueuesize_parameter>::=MailboxQueueSize size</mailboxqueuesize_parameter>
Description:	This option sets the size of the message queue leaving the mailbox ISR. The default size is 8.
Mem	ory Pair Pool Size Parameter:
	<mempairpoolsize_parameter>::=MemPairPoolSize size</mempairpoolsize_parameter>
Description:	This option sets the size of the memory pool for memory pairs used by all "push" channels on the board. The default size is 8.
Partit	tion Address Parameter:
	<pre><partitionaddr_parameter>::=PartitionAddress addr</partitionaddr_parameter></pre>
Description:	This option sets the location of the memory partition created by the VCU for VME bus accessibility to the value specified in addr.
Partit	ion Factor Parameter:
	<pre><partitionfactor_parameter>::=PartitionFactor factor</partitionfactor_parameter></pre>
Description:	This option sets the factor used in setting the size of the partition.
Slave	Window Size Parameter:
	<slavewinsize_parameter>::=SlaveWindowSize half SlaveWindowSize full</slavewinsize_parameter>
Description: 0x04000000 and	This option sets the size of the VME slave windows for boards in the system. "Half" sets the size to "full" to 0x08000000, with the default being half.
Task	Priority Parameter:
	<taskpriority_parameter>::=TaskPriority priority</taskpriority_parameter>
Description:	This option sets the <i>priority</i> for the VCU socket task.
DMA I	Parameter:
_	<dma_parameter>::=DMA chan_number</dma_parameter>
Description:	This option turns forces the indicated chan_number to always use DMA.
DMA S	Start Parameter:
	<pre><dmastart_parameter>::=DMAStart chan_number message_size</dmastart_parameter></pre>
Description: greater than or e	This option forces the indicated chan_number to always use DMA for messages that have sizes that are qual to message_size bytes.

	VCU Configuration File Grammar: Backus-Naur Form (BNF) (cont.)
	Misc Ilaneous Parameters Section (cont.):
Even	t Parameter:
	<event_parameter>::=Event chan_number event_handler</event_parameter>
Description:	This option specifies the routine (event_handler) to be called when a board receives a message for the channel indicated by channel_number.
Guar	anteed Delivery Parameter:
	<pre><guaranteeddel_parameter>::=GuaranteedDelivery chan_number</guaranteeddel_parameter></pre>
Description:	This option forces the indicated <i>chan_number</i> to block on certain queue and pool overflows rather than risk losing the message.
Rece	ive Pool Size Parameter:
	<pre><rxpoolsize_parameter>::=RxPoolSize chan_number size</rxpoolsize_parameter></pre>
Description:	This option sets the size of the receiving memory pool for the indicated chan_number. The default value is 8.
Rece	ve Queue Size Parameter:
	<rxqueuesize_parameter>::=RxQueueSize chan_number size</rxqueuesize_parameter>
Description:	This option sets the size of the receiving message queue for the indicated chan_number. The default value is 8.
Trans	mit Pool Size Parameter:
	<txpoolsize_parameter>::=TxPoolSize chan_number size</txpoolsize_parameter>
Description:	This option sets the <i>size</i> of the transmitting memory pool for the indicated <i>chan_number</i> . The default value is 8.

Inventor(s):

Docket #

Express Mail. No. EV328618105US 66638/40337

Keyword: Parameters:		Meaning:	
AckMailbox	1	"AckMailbox" indicates the mailbox used for the automatic acknowledgement. It should differ from the "DataMailbox" value. The default value is 2.	
AutoAckOff	0	"AutoAckOff" turns off the automatic acknowledgement system for the VCU. With auto ack turned off, the VCU uses only one mailbox interrupt per board, but cannot guarantee that messages will not be lost.	
AutoAckOn	1	"AutoAckOn" turns on the automatic acknowledgement system for the VCU. The parameter sets the delay for an acknowledgement from the receiving board before the message is assumed lost. The default value for the parameter is 0.05 (in seconds).	
BoardCount	1	"BoardCount" specifies the number of boards in the system. This value is only used in conjunction with "NoRxPool" and "NoTxPool".	
Chan	4 (or 5)	"Chan" specifies a data type, channel name, and configuration type for one channel. Specifying "Chan" a second time for a channel resets the DMA size specs, even if they were changed from default by a "DmaStart" line. "Chan 0" is not allowed. Also, "Chan" cannot be specified before "Channels".	
Channels	1	"Channels" specifies the number of channels in the VCU. It should not appear more than once in the configuration file.	
DataMailbox	1	"DataMailbox" indicates the mailbox used by the VCU for inter-board communication. It must differ from the "AckMailbox" value. The default value is 1.	
DebugOn	0	Turns on printing of all values received in the data mailbox interrupt	
DMA	1	"DMA" specifies that the indicated channel should always use DMA.	
DmaStart	2	"DmaStart" specifies that the indicated channel should use DMA for any message larger than that specified by the second parameter (the size being in bytes).	
Event	2	"Event" specifies a routine that should be called as soon as a board receives data on the indicated channel. The first parameter is the channel, and the second parameter is the routine (the routine preferably cannot take any input argument and cannot return any value).	
GuaranteedDelivery	1	"GuaranteedDelivery" indicates that the channel will block on certain queue and pool overflows, rather than lose the message. The queue and pool overflows in question are those that are unreportable as returns to vcuSend(), vcuRecv(), or vcuFree() calls. Blocking on these overflows blocks all incoming messages for the board in question and can result in other queues and pools overflowing.	
Handlers	1	"Handlers" specifies the number of files to be included in the vcuConfig.cpp file. It should not be called twice.	
Hndlr	1	"Hndlr" specifies a file to be included in the vcuConfig.cpp file. If too many or too few files are specified, the autoConfig code declares the configuration invalid. "Hndlr" should not be specified before "Handlers".	
Includes	1	"Includes" specifies the number of files to be included in the file vcuInterface.h. "Includes" should not be called more than once.	
Incl	1	"Incl" specifies a file to be included in the file vcuInterface.h. If too many or too few files are specified, the autoConfig code declares the configuration invalid. "Incl" should not be specified before "Includes".	
MailboxQueueSize	1	"MailboxQueueSize" specifies the size of the msgQ leaving the mailbox ISR. The default value is 8.	
MemPairPoolSize	1	"MemPairPoolSize" specifies the size of the memory pool for memory pairs (used in the "push" configuration types). This is a board-wide memory pool, used by all channels. The default value is 8.	

Method And Apparatus For Communicating Data Over A Bus According To Redefinable Configurations Winkeler et al.

Inventor(s): Winkeler et al. Express Mail. No. EV328618105US Docket # 66638/40337 66638/40337

Keyword:	Parameters:	Meaning:	
No_DMA	1	"No_DMA" specifies that the indicated channel should never use DMA.	
NoRxPool	2	"NoRxPool" specifies a channel and board where the VCU should not support receive operations. The first parameter is the channel and the second parameter is the board's system processor number. If NoRxPool is specified for any board in a channel, then the system processor numbers should be in the range of 0 to BoardCount-1.	
NoTxPool	2	"NoTxPool" specifies a channel and board where the VCU should not support transmit operations. The first parameter is the channel and the second parameter is the board's system processor number. If NoTxPool is specified for any board in a channel, then the system processor numbers should be in the range of 0 to BoardCount-1.	
PartitionAddress	1	"PartitionAddress" specifies the location of the memory partition created by the VCU for VME bus accessibility.	
PartitionFactor	1	"PartitionFactor" specifies the factor used in setting the size of the partition. Buffers used to receive data in the "push to buffer on receive" configuration type are allocated from here, so these drive the size of the partition factor. The factor also allows for fragmented allocation because of the memory alignment specified in the allocation.	
RxPoolSize	2	"RxPoolSize" specifies the size of the receiving memory pool for a channel. The first parameter is the channel, and the second parameter is the pool size. The default value is 8.	
RxQueueSize	2	"RxQueueSize" specifies the size of the receiving queue for a channel. The first parameter is the channel, and the second parameter is the queue size. The default value is 8.	
RxReplyQueueSize	1	"RxReplyQueueSize" specifies the size of the queue delivering responses from the VCU Rx Task to the vcuRecv() routine.	
RxRqstQueueSize	1	"RxRqstQueueSize" specifies the size of the queue delivering vcuRecv() requests to the VCU Rx Task.	
RxTaskCount	1	"RxTaskCount" specifies the number of tasks set aside to handle vcuRecv() calls. The first task handles all non-blocking calls, while the other tasks handle blocking calls. The minimum value should be 2 unless vcuRecv() will never be called as blocking. The default value is 4.	
SlaveWindowSize	1	"SlaveWindowSize" specifies the size of the slave windows for boards in the system. The valid options are "half" and "full", which correspond to 0x04000000 and 0x08000000. The default value is "half".	
TaskPriority	2	"TaskPriority" specifies the priority of the indicated task, "Socket", "Tx", "Rx", or "Debug". The default value is 100 for all tasks.	
TxPoolSize	2	"TxPoolSize" specifies the size of the transmitting memory pool for a channel. The first parameter is the channel, and the second parameter is the pool size. The default value is 8.	
TxReplyQueueSize	1	"TxReplyQueueSize" specifies the size of the queue that delivers update responses from the VCU Tx Task to the vcuSend() routine.	
TxRqstQueueSize	1	"TxRqstQueueSize" specifies the size of the queue that delivers vcuSend() requests to the task that actually performs the data transmission (the VCU Tx Task).	
TxStatusQueueSize	1	"TxStatusQueueSize" specifies the size of the queue that delivers status responses from the VCU Tx Task to the vcuSend() routine.

Inventor(s): Docket #

Express Mail. No. EV328618105US 66638/40337

Constant:	Value:	Meaning:
VCU_ERROR_NO_CODE	0x1	Mainly used internally, but also used as a return value for a multicast "vcuRequestErrno()" so this routine can be used to check whether any errors exist in the system
VCU_SUCCESS	0x2	The VCU command operated successfully
VCU_RECV_EMPTY	0x3	The non-blocking vcuRecv() command found no message.
VCU_BAD_CHANNEL	0x4	An unexpected channel was received. This can be directly, from an API call, or indirectly, from data corrupted when copied across the VME bus.
VCU_MSGQ_FULL	0x5	Used internally on a vcuSend() when the channel is configured for copy to self.
VCU_POOL_FULL	0x6	The vcuSend() or vcuRecv() call could not find sufficient memory space in the memory pool to perform the send or receive.
VCU_NO_RECV_TASK	0×7	The vcuRecv() call is a blocking call, but no task is available for a blocking receive call. To fix: configure the system to have more receive tasks.
VCU_ERR_ON_RECV	0x10000	The error occurred in a section of code responsible for receiving. The code is most likely specific to handling vcuRecv().
VCU_ERR_ON_SEND	0x20000	The error occurred in code specific to handling vcuSend().
VCU_ERR_ON_FREE	0x30000	The error occurred in code specific to handling vcuFree ().
VCU_ERR_ON_PING	0x40000	The error occurred in code specific to handling vcuPing().
VCU_ERR_ON_TEST_PAT	0x50000	The error occurred in code specific to handling vcuRequestTestPattern().
VCU_ERR_ON_CONFIG	0x60000	The error occurred at initialization
VCU_ERR_ON_ERRNO	0x70000	The error occurred in code specific to handling vcuRequestErrno(). These error numbers are not stored, so that stored errors can be differentiated from errors that occur at the time of the request
VCU_ERR_IN_SOCKET	0x01000	The error occurred in code in VcuSocket.cpp.
VCU_ERR_IN_RXQUEUE	0x02000	The error occurred during an RxQueues method.
VCU_ERR_IN_MAILBOX	0x03000	The error occurred in mailbox management, in the file VcuMailbox.cpp.
VCU_ERR_IN_INTERFACE	0x04000	The error occurred in the interface to the vcuSocket, in VcuComm.cpp.
VCU_ERR_IN_RX_TASK	0x05000	The error occurred in code in VcuComm.cpp in logic specific to Rx Task management.
VCU_ERR_IN_TX_TASK	0x06000	The error occurred in code in VcuComm.cpp in logic specific to Tx Task management.
VCU_ERR_IN_VME_COPY	0x07000	The error occurred in code responsible for copying data across the VME bus.
VCU_ERR_IN_RXPOOL	0x08000	The error occurred in a RxPools method.
VCU_ERR_IN_TXPOOL	0x09000	The error occurred in a TxPools method.
VCU_ERR_IN_PAIRPOOL	0x0a000	The error occurred in a MemPairPool method.
VCU_ERR_IN_ACK	0x0b000	The error occurred in code responsible for handling an automatic acknowledgement.

Method And Apparatus For Communicating Data Over A Bus According To Redefinable Configurations

Inventor(s): Winkeler et al.

Express Mail. No. EV328618105US

Docket # 66638/40337

Constant:	Value:	Meaning:
VCU_ERR_NO_MEMORY	0x00010	The error occurred when requested memory is unavailable.
VCU_ERR_MSGQ_RECV	0x00020	The error occurred while trying to receive from a msgQ.
VCU_ERR_DATA_SYNCH	0x00030	The error occurred when VcuSocket tried to free a memory pool slot already freed or during RequestDataPush() when the incorrect identifier came back. The latter requires rewriting the Push communication protocol.
VCU_ERR_INTERNAL	0x00040	The error occurred when the flow reached a section of code it should not have reached.
VCU_ERR_BAD_POOL_SLOT	0x00050	The error occurred when the VcuSocket tried to Free() memory that did not come from the pool specified.
VCU_ERR_BAD_MAILBOX	0x00060	The error occurred when the VcuSocket tried to TriggerRemoteBoard() to itself or a destination outside the system boundaries.
VCU_ERR_BAD_MCAST	0x00070	The error occurred because the VCU was reconfigured so that the destinations are not specified bitwise, or a multicast was attempted on a channel configured for updating ("push")
VCU_ERR_UNLOCK_FAILED	0x00080	The error occurred during Update() when the system was unable to unlock a memory slot it just locked. This should never occur.
VCU_ERR_MSGQ_FULL	0x00090	The error occurred when a send to a msgQ found the msgQ full.
VCU_ERR_MSGQ_SEND	0x000a0	The error occurred while trying to send to a msgQ. The error is not a full msgQ error.
VCU_ERR_BAD_CONFIG	0x000b0	The error occurred when the VCU tables were in conflict with the kernel configuration.
VCU_ERR_TRIG_FAILED	0x000c0	The error should only occur when automatic acknowledgement is enabled. The error means that the automatic ack was not received. vcuPing() can be tried to make sure that the board is accessible. The return value is VCU_SUCCESS for a successful vcuPing().
VCU_ERR_MSG_TOO_BIG	0x000d0	The error occurred when the size of the message was larger than the capacity of the channel.
VCU_ERR_DEST_INVALID	0x000e0	The error occurred when a vcuPing() or vcuRequestTestPattern() found an invalid destination specified.
VCU_ERR_TASK_DIED	0x000f0	The error occurred when a receive task is found to be inaccessible.
VCU_ERR_VME_DMA	0x00100	The error occurred when a sysVmeDmaCopy() returned an error value.
VCU_ERR_ISR_USE	0x00200	The error occurred when vcuSend() was called from an ISR.
VCU_MBOX_FULL_QUEUE 0xff		The error occurred when the receiver's mailbox ISR found its outgoin msgQ full. The message is lost, but the sender gets an error message.
VCU_MBOX_QUEUE_ERROR	0xfe	The error occurred when the receiver's mailbox ISR found its outgoing msgQ broken (not just full). The message is lost, but the sender gets an error message. All further messages are likely to get the same response.

Method And Apparatus For Communicating Data Over

A Bus According To Redefinable Configurations

Inventor(s): Docket #

Winkeler et al. Express Mail. No. EV328618105US 66638/40337
